SCENARIO TABLE

Rate Scenario	Discount Up %	Fee Up %
Aggressive	20%	5%
Base	10%	3%
Conservative	5%	1%

Recommended Scenario: Best Rate Increase

The Base scenario provides a balanced revenue opportunity while limiting pricing pressure compared with the Aggressive scenario. Under the sensitivity model, the Base scenario remains revenue-positive up to approximately 6% attrition, while the Conservative scenario becomes negative shortly after 3% attrition.

Although the Aggressive scenario provides the highest uplift and strongest break-even tolerance, I would recommend applying it only after manual review of high-value, high-effective-rate, or non-standard-status customers. The Base scenario is the safer default recommendation because it still produces positive uplift under moderate attrition assumptions while reducing the risk of overpricing sensitive customers.

Pricing Risk Readout

The proposed increase should not be applied uniformly. Customers above the P90 threshold for **effective rate** or **per-transaction fee burden** are already carrying higher relative pricing pressure, so applying the full increase may create avoidable retention risk.

Recommended Action

Use the **capped-increase rule** for **high-burden accounts** and route **non-standard-status** or strategically **large customers** for manual review before implementation.
