

Chandra “Nat” Limiarja

Senior Analyst · BI & Reporting · Decision Support

Analytics & Reporting Portfolio Summary

Toronto, ON | chandra.limi16@gmail.com | linkedin.com/in/chanlimi16

Portfolio focus

I build reporting systems, decision-support tools, and analytical dashboards that turn fragmented data, KPI definitions, and stakeholder questions into repeatable, decision-ready outputs. The projects below show a mix of pricing strategy, source-of-truth design, reporting automation, survey benchmarking, and Power BI dashboarding.

Featured Projects

Payments Pricing Strategy Decision Tool

Pricing strategy · revenue uplift · attrition sensitivity · customer pricing risk

Built an interactive Tableau decision tool to evaluate whether payment-processing rate increases could generate meaningful revenue without creating unacceptable customer attrition or pricing-risk exposure.

What it demonstrates

- Modeled revenue uplift using rate, fee, and attrition assumptions.
- Calculated break-even attrition and projected run-rate impact.
- Separated customers into standard increase, capped/manual review, exclusion, or strategic-account review.

Tools:

Tableau · Python · Excel · parameter controls · sensitivity analysis

Global Distributor Sales Reporting System

Reporting system · source-of-truth logic · KPI monitoring across 38 markets

Designed an end-to-end reporting workflow that transformed fragmented distributor Excel submissions into a centralized reporting layer and Tableau dashboard suite for executive monitoring across 38 international markets.

What it demonstrates

- Standardized inconsistent country-level files and reporting structures.
- Defined KPI logic for YTD sales, growth vs. last year, and target achievement.
- Connected file intake, transformation, SQL/SSIS ingestion, and dashboard output.

Tools:

Tableau · SQL Server / SSIS · UIPath · Excel · KPI modeling

Customer Profile Source-of-Truth & Retention Segmentation

Customer data mapping · profile completeness · product-level churn · segmentation

Built a field-level customer source-of-truth layer at KoinWorks by combining BigQuery warehouse tables, OCR outputs, JSON/data-lake records, spreadsheet enrichment, and derivation logic to improve mandatory profile-field completeness and support downstream churn analysis.

What it demonstrates

- Defined survivorship rules by field rather than assuming one table was correct for everything.
- Improved completeness for critical mandatory attributes such as ID number, DOB, gender, phone number, and province.
- Used the cleaned profile layer to compare platform churn and product-level churn across demographic and product segments.

Tools:

BigQuery · SQL · Tableau · data quality rules · Airflow-ingested data mart

Customer data foundation to churn segmentation workflow

Source completeness first; product and demographic retention insight second.

Survey Benchmark Comparison Dashboard

Survey analytics · category benchmarking · weighted reporting

Built a Tableau survey reporting dashboard that compared category performance against segment and total-market benchmarks, helping stakeholders move beyond static crosstabs toward faster, more flexible interpretation.

What it demonstrates

- Reshaped looped respondent data from wide format into stacked, dashboard-ready format.
- Supported Total vs. Segment vs. Category comparisons in one framework.
- Handled weighted reporting, T2B/B2B rollups, average-based metrics, and sample-size visibility.

Tools:

Tableau · Python · LOD expressions · calculated fields · survey reporting logic

Municipal Satisfaction Benchmark Dashboard

Power BI · demographic benchmarking · improvement-priority analysis

Built a solo Power BI case study using municipal citizen satisfaction survey data for municipal citizen satisfaction analysis, combining province-level benchmarking, weighted vs. unweighted views, demographic profiling, recovery-priority logic, and exploratory correlation analysis.

What it demonstrates

- Compared respondent profile against StatsCan benchmarks using age, gender, and province weighting.
- Highlighted lower-rated service areas to support follow-up improvement discussions.
- Used exploratory correlation analysis to identify stronger relationships between taxation, service satisfaction, and recommendation.

Tools:

Power BI · DAX · Power Query · survey benchmarking · exploratory analysis
